Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

**EP 0 824 628 B1**

## Description

This invention relates to a connector assembly for use in connecting sections of expandable tubing, and in particular but not exclusively for use in the connection of sections of expandable slotted tubing (EST) as utilised in downhole applications in the oil and gas exploration and extraction industries.

Expandable slotted tubing (EST), such as described in W093\25800 (Shell Internationale Research Maatschappij B.V.), may be used in various downhole applications. The tubing comprises lengths of tube which have been machined to create a large number of longitudinal slots. Thus, it is relatively easy to expand the tube radially outwardly by, for example, running a mandrel through the tubing. The expansion causes the slots to extend to create diamondshaped apertures. The tubing is useful where it is desired to, for example, line a bore below a restriction without further reducing the diameter of the bore. Using conventional tubing the outer diameter of the tubing must, by necessity, be of smaller diameter than the restriction, to permit the tubing to be passed through the restriction. This reduction in the bore diameter has a number of significant effects, primarily in reducing the production capabilities of the bore. Using EST, the tubing may pass through a restriction into a reamed section of bore below the restriction. The tubing may then be expanded to a diameter larger than the restriction.

EST is supplied in lengths which are, at present, made up into a string by welding the lengths to one another. This is relatively time consuming and expensive and in many situations, for example in an off-shore operation in bad weather, it may be difficult to maintain consistent weld quality. Safety problems may also arise due to the high temperatures and exposed flames or sparks created by a welding operation. Further, in the event of a "mis-run", requiring the welded lengths of tube forming the EST string to be separated, the tubing must be cut, and the cut tubing may not be suitable for re-use.

It is among the objectives of the present invention to provide a means of connecting sections of EST which obviates or mitigates these difficulties.

According to the present invention there is provided a connector assembly for connecting expandable slotted tubing, the assembly comprising tubular first and second parts for mounting on the ends of respective lengths of slotted tubing, the parts being slotted and the free end of the first part defining a male portion and the free end of the second part defining a female portion such that the free ends of the parts are adapted to engage with one another and to permit expansion of the coupled parts in a corresponding manner to the tubing.

According to a further aspect of the present invention there is provided a method of connecting expandable slotted tubing, the method comprising:

providing first and second lengths of slotted tubing;

providing tubular slotted first and second parts on the ends of the respective tubing lengths, the free end of the first part defining a male portion and the free end of the second part defining a corresponding female portion; and

coupling said male and female portions to connect the first and second tubing lengths.

The invention further relates to a method of locating such connected lengths of slotted tubing in a bore, including the step of radially expanding the lengths of tubing and said first and second parts to form a length of expanded tubing of substantially constant internal diameter.

As used herein, the term "slotted" or "slots" is intended to encompass any cutting, machining or weakening of a tubular structure intended to facilitate radial expansion, including: slots which extend only partially through the tube wall and which permit the remaining thinned wall sections to fracture or extend; and lines of drilled holes.

The parts may be arranged with the respective slots aligned, though this is not considered essential to the successful expansion of the assembly.

Preferably, the parts define corresponding screw threads, such that the parts may be made up by relative rotation. Alternatively, the parts may be adapted to allow make up by stabbing in or most preferably by a combination of stabbing and rotation.

In a preferred arrangement fasteners are provided for securing the parts to one another; this prevents radial separation of the free ends of the parts when the connected tubing is expanded and prevents rotation of one part relative to the other. Most preferably, fasteners are located adjacent the free end of the outer female portion, to prevent the end from flaring outwardly on the tubing being expanded. The fasteners may be releasable, for example short screws for location in appropriate holes provided in the parts, such that the tubing may be separated in the event of a mis-run. The use of screws and the like, and the associated screw-holes, also provides a convenient means for ensuring that the parts are in a desired alignment.

Preferably also, the parts define corresponding threads and are also securable to one another by fasteners. Most preferably, the fasteners engage the female portion between the free end and the threaded portion thereof. This arrangement may be provided at any point in the slot pattern. In an alternative arrangement fasteners may also be provided to engage the male portion between the free end and the threaded portion thereof. With this arrangement it is preferred that threaded portions are located on the "nodes" of the parts, between the slot ends, that are not deformed by expansion of the assembly.

Preferably also, the portion of each part for engaging the free end of the other part includes an undercut ledge or groove, and the free end of the other part de-

defines a tongue to locate in the groove. One or both of said portions may define a back angle to engage with a lip on the end of the other part. This minimises the possibility of the free ends flaring on expansion of the tube; such flaring of the male end would create an irregularity in the tubing bore on which tools might be snagged. Where the parts are threaded, the lipped free end of the male portion is preferably arranged to deflect inwardly to pass the female thread, and to allow the parts to be at least partially made-up by stabbing in. Such deflection may be accommodated by providing a living hinge on the male portion.

The parts may be formed integrally with the respective tubing lengths, or may be welded or otherwise secured thereto; the welding or securing operation may be carried out in a manufacturing or assembly facility, such that the tubing lengths may be delivered to sites ready for connection.

External shoulders may be provided on the connector assembly on one or both parts to facilitate handling of the assembly and the connected tubing. Preferably, the shoulders are provided at nodes of the parts.

These and other aspects of the present invention will now be described, by way of example, with reference to the accompanying drawings, in which:

Figure 1 is a sectional view of a length of expandable slotted tubing (EST), shown in an expanded configuration;

Figure 2 is a sectional view on line 2 - 2 of Figure 1, and also shows the EST in unexpanded configuration;

Figure 3 is a half section of a connector assembly in accordance with a preferred embodiment of the present invention, with the parts of the assembly shown separated; and

Figure 4 is a half section of the connector assembly of Figure 3, showing the parts connected.

Reference is first made to Figures 1 and 2 of the drawings, which illustrate a length of expandable slotted tubing (EST) 10. In its initial configuration, the tubing 10 is simply a length of pipe in which a series of longitudinal slots 12 have been machined (shown as tube 10a with slots 12a in Figure 2). Applying a radially outward force to the tubing wall, for example by passing a mandrel through the tubing, causes the tube to expand such that the slots 12a become diamond shaped openings 12b, as described in W093/25800.

The tubing 10 is supplied in lengths suitable for transportation and handling and these are joined to one another on surface to create a tubular string. The connector assembly 20 as illustrated in Figures 3 and 4 of the drawings is used to connect such tubing lengths. The assembly 20 comprises a first part 22 and a second part 24, which are mounted on the ends of the respective tubing lengths. In this particular example the parts 22, 24 are adapted to be welded to the tubing ends. The

parts 22, 24 are intended to expand in a similar manner to the tubing 10, and as such are provided with similar longitudinal slots 26.

The free end of the first part 22 is machined to form a male portion 28 and the free end of the second part 22 defines a corresponding female portion 30 adapted to receive the male portion 28, as will be described. Both portions 28, 30 carry corresponding screw threads 32, 33 such that the parts 22, 24 may be made up by relative rotation. The threads are located on the "nodes" 27a, 27b of the fingers 40, 41 formed by the slots 26, that is the areas between the slot ends which remain substantially undeformed following expansion of the assembly 20.

Each part, 22, 24 also defines a respective undercut ledge 34, 35 for engaging the free end of the other part 36, 37, which is of corresponding form. The ledge 35 formed on the second part 24 defines a back angle and cooperates with a radially extending lip 39 on the free end of the first part 36. This serves to prevent the free ends of one part separating from the other part on expansion of the tubing. To permit the free end 36 of the first part to be deflected inwardly, allowing the lip 39 to pass within the screw thread 33 on the second part, the first part 22 defines a living hinge 38. It will be noted that the hinge 38 is spaced a relatively long distance from the free end 36, such that only small degree of deflection is necessary at the hinge 38 to allow the free end 36 to pass the screw threads 33.

As noted above, the slots 26 in the parts 22, 24 are arranged such that the free ends 36, 37 of the parts each define fingers 40, 41, and each of these fingers defines a hole 42, 43. The holes 43 in the second part are countersunk, whereas the holes 42 in the first part 22 are threaded such that the fingers 40, 41 may be secured to one another using a number of short screws 44. The screws 44 are located adjacent the free end of the second part, as the fingers 41 will have a tendency to flare outwardly on expansion of the tubing. In addition, a line of screws may also be provided on the other side of the threads 32, 33, and in this case it may not be necessary to provide a back angle on the ledge 35, as the additional set of screws will prevent the expanded fingers 40 from separating from the expanded part 24. If the back angle on the ledge 35 is not required, the radially extending lip 39 may be omitted and thus there is no requirement to provide the living hinge 38.

To connect two lengths of tubing provided with the tubing connector assembly 20, the parts 22, 24 are brought together, or stabbed in, such that the free end 36 of the first part passes inside the free end 37 of the second part, the end 36 being deflected inwardly to ride under the screw thread 33. Once the screw threads 32, 33 come together the first part 22 is rotated relative to the second part 24 until the parts 22, 24 are securely engaged. If necessary, the first part 22 is then rotated in the opposite direction to bring the holes 42, 43 into alignment, which also serves to bring the slots 26 in the

parts 22, 24 into alignment. The screws 44 are then secured in the holes 42, 43.

The desired number of tubing sections are connected in this manner to form a string and run downhole to the desired location within the bore. The tubing and the connector assemblies may then be expanded to the desired diameter. However, in the event of a mis-run, requiring the tubing to be withdrawn and disassembled, this may be achieved relatively easily by removing the screws 44, unscrewing the first and second parts 22, 24 and then withdrawing the male portion 28 from the female portion 30.

It will be clear to those of skill in the art that the above-described embodiment is merely exemplary of the present invention, and may be subject to various modifications and improvements without departing from the scope of the invention, as defined by the appended claims.

#### Claims

1. A connector assembly (20) for connecting expandable slotted tubing (10), the assembly comprising tubular first and second parts (22, 24) for mounting on the ends of respective lengths of slotted tubing, the parts being slotted (26) and the free end of the first part defining a male portion (28) and the free end of the second part defining a female portion (30) such that the free ends of the parts are adapted to engage with one another and to permit expansion of the coupled parts in a corresponding manner to the tubing.
2. The connector assembly of claim 1 wherein the parts (22, 24) are arranged with the respective slots (26) aligned.
3. The connector assembly of claim 1 or 2, wherein the parts (22, 24) define corresponding screw threads (32, 33), such that the parts may be made up by relative rotation.
4. The connector assembly of claim 1, 2 or 3, wherein the parts (22, 24) are adapted to allow make up by stabbing in.
5. The connector assembly of any of the preceding claims wherein the parts (22, 24) define corresponding screw threads (32, 33) and are adapted to allow make up by a combination of stabbing in and rotation.
6. The connector assembly of any of the preceding claims wherein fasteners (44) are provided for securing the parts (22, 24) to one another.
7. The connector assembly of claim 6, wherein the fasteners (44) are located adjacent the free end of the female portion (30), to prevent the end from flaring outwardly on the tubing being expanded.
8. The connector assembly of claim 6 or 7, wherein the fasteners (44) are releasable.
9. The connector assembly of claim 8, wherein the fasteners are screws (44) for location in appropriate holes (42, 43) provided in the parts (22, 24), such that the tubing may be separated in the event of a mis-run.
10. The connector assembly of any of the preceding claims wherein the parts (22, 24) define corresponding threads (32, 33) and are also securable to one another by fasteners (44).
11. The connector assembly of claim 10, wherein the fasteners (44) engage the female portion (30) between its free end and the thread (33) thereon.
12. The connector assembly of claim 11, wherein fasteners are also provided to engage the male portion (28) between its free end and the thread (32) thereon.
13. The connector assembly of any of the preceding claims, wherein the parts (22, 24) define corresponding screw threads (32, 33) and the threads are located on the nodes of the parts.
14. The connector assembly of any of the preceding claims wherein the portion of each part (22, 24) for engaging the free end of the other part (24, 22) includes an undercut groove (34, 35), and the free end of the other part defines a tongue (37, 36) to locate in the groove (34, 35).
15. The connector assembly of claim 14, wherein at least one of said portions defines a back angle to engage with a lip (39) on the end of the other part.
16. The connector assembly of claim 15, wherein the free end of the male portion (28) is provided with a lip (39) and is arranged to deflect inwardly to allow the parts to be at least partially made-up by stabbing in.
17. The connector assembly of claim 16, wherein said deflection is accommodated by providing a living hinge (38) on the male portion (28).
18. The connector assembly of any of the preceding claims wherein the parts (22, 24) are formed integrally with the respective tubing lengths (10).
19. The connector assembly of any of claims 1 to 17,

wherein the parts (22, 24) are adapted to be welded to the respective tubing lengths (10).

20. The connector assembly of any of the preceding claims wherein external shoulders are provided on one or both parts (22, 24) to facilitate handling of the assembly (20) and the connected tubing (10).
21. The connector assembly of claim 20, wherein the shoulders are provided at nodes of the parts (22, 24).
22. A method of locating lengths of slotted tubing (10) connected with the connector assembly (20) of any of the preceding claims in a bore, including the step of radially expanding the lengths of tubing (10) and said first and second parts (22, 24) to form a length of expanded tubing of substantially constant internal diameter.
23. A method of connecting expandable slotted tubing; the method comprising:
  - providing first and second lengths of slotted tubing (10);
  - providing tubular slotted first and second parts (22, 24) on the ends of the respective tubing lengths (10), the free end of the first part defining a male portion (28) and the free end of the second part defining a corresponding female portion (30); and
  - coupling said male and female portions (28, 30) to connect the first and second tubing lengths (10).

#### Patentansprüche

1. Verbindieranordnung (20) für das Verbinden eines expandierbaren geschlitzten Rohres (10), wobei die Anordnung rohrförmige erste und zweite Teile (22, 24) für das Montieren auf den Enden der entsprechenden Längen des geschlitzten Rohres aufweist, wobei die Teile geschlitzt (26) sind, und das freie Ende des ersten Teils einen Außenabschnitt (28) und das freie Ende des zweiten Teils einen Innenabschnitt (30) definiert, so daß die freien Enden der Teile so ausgeführt sind, daß sie miteinander in Eingriff kommen und die Expansion der gekoppelten Teile in einer entsprechenden Weise wie das Rohr gestatten.
2. Verbindieranordnung nach Anspruch 1, bei der die Teile (22, 24) mit den entsprechenden Schlitzten (26) ausgerichtet angeordnet sind.
3. Verbindieranordnung nach Anspruch 1 oder 2, bei der die Teile (22, 24) entsprechende Schraubge-

winde (32, 33) definieren, so daß die Teile durch relative Drehung zusammengesetzt werden können.

4. Verbindieranordnung nach Anspruch 1, 2 oder 3, bei der die Teile (22, 24) so ausgeführt sind, daß ein Zusammensetzen durch Hineinstoßen ermöglicht wird.
5. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der die Teile (22, 24) entsprechende Schraubgewinde (32, 33) definieren und so ausgeführt sind, daß sie ein Zusammensetzen durch eine Kombination von Hineinstoßen und Drehung gestatten.
6. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der Befestigungseinrichtungen (44) für das Sichern der Teile (22, 24) aneinander bereitgestellt werden.
7. Verbindieranordnung nach Anspruch 6, bei der die Befestigungseinrichtungen (44) angrenzend an das freie Ende des Innenabschnittes (30) angeordnet werden, um zu verhindern, daß sich das Ende am Rohr, das expandiert wird, nach außen aufweitet.
8. Verbindieranordnung nach Anspruch 6 oder 7, bei der die Befestigungseinrichtungen (44) lösbar sind.
9. Verbindieranordnung nach Anspruch 8, bei der die Befestigungseinrichtungen Schrauben (44) für eine Anordnung in geeigneten Löchern (42, 43) sind, die in den Teilen (22, 24) vorhanden sind, so daß das Rohr im Fall eines Fehllaufes getrennt werden kann.
10. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der die Teile (22, 24) entsprechende Gewinde (32, 33) definieren und ebenfalls aneinander mittels Befestigungseinrichtungen (44) befestigt werden können.
11. Verbindieranordnung nach Anspruch 10, bei der die Befestigungseinrichtungen (44) mit dem Innenabschnitt (30) zwischen seinem freien Ende und dem Gewinde (33) darauf in Eingriff kommen.
12. Verbindieranordnung nach Anspruch 11, bei der Befestigungseinrichtungen ebenfalls vorhanden sind, um mit dem Außenabschnitt (28) zwischen seinem freien Ende und dem Gewinde (32) darauf in Eingriff zu kommen.
13. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der die Teile (22, 24) entsprechende Schraubgewinde (32, 33) definieren und die Gewinde auf den Knotenpunkten der Teile angeordnet sind.

14. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der der Abschnitt eines jeden Teils (22, 24) für das Eingreifen des freien Endes des anderen Teils (24, 22) eine unterschrittene Nut (34, 35) umfaßt, und das freie Ende des anderen Teils eine Feder (37, 36) definiert, die in der Nut (34, 35) angeordnet wird. 5
15. Verbindieranordnung nach Anspruch 14, bei der mindestens einer der Abschnitte einen Rückenwinkel definiert, um mit einer Nase (39) am Ende des anderen Teils in Eingriff zu kommen. 10
16. Verbindieranordnung nach Anspruch 15, bei der das freie Ende des Außenabschnittes (28) mit einer Nase (39) versehen und so angeordnet ist, daß sie nach innen durchgebogen wird, damit die Teile zumindestens teilweise durch Hineinstoßen zusammengesetzt werden können. 15
17. Verbindieranordnung nach Anspruch 16, bei der die Durchbiegung aufgenommen wird, indem ein bewegliches Gelenk (38) am Außenabschnitt (28) vorgesehen wird. 20
18. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der die Teile (22, 24) in einem Stück mit den entsprechenden Rohrlängen (10) gebildet werden. 25
19. Verbindieranordnung nach einem der Ansprüche 1 bis 17, bei der die Teile (22, 24) so ausgeführt sind, daß sie auf die entsprechenden Rohrlängen (10) geschweißt werden können. 30
20. Verbindieranordnung nach einem der vorhergehenden Ansprüche, bei der äußere Vorsprünge auf einem oder beiden Teilen (22, 24) vorhanden sind, um die Handhabung der Anordnung (20) und des verbundenen Rohres (10) zu erleichtern. 35
21. Verbindieranordnung nach Anspruch 20, bei der die Vorsprünge an den Knotenpunkten der Teile (22, 24) vorhanden sind. 40
22. Verfahren zur Anordnung von Längen des geschlitzten Rohres (10), das mit der Verbindieranordnung (20) nach einem der vorhergehenden Ansprüche verbunden ist, in einer Bohrung, das den Schritt des radialen Expandierens der Längen des Rohres (10) und des ersten und zweiten Teils (22, 24) umfaßt, um eine Länge des expandierten Rohres mit im wesentlichen konstanten Innendurchmesser zu bilden. 45
23. Verfahren zur Verbindung eines expandierbaren geschlitzten Rohres, wobei das Verfahren aufweist: 50
- Bereitstellen erster und zweiter Längen des geschlitzten Rohres (10);  
Bereitstellen von rohrförmigen, geschlitzten ersten und zweiten Teilen (22, 24) an den Enden der entsprechenden Rohrlängen (10), wobei das freie Ende des ersten Teils einen Außenabschnitt (28) und das freie Ende des zweiten Teils einen entsprechenden Innenabschnitt (30) definiert; und  
Koppeln des Außen- und Innenabschnittes (28, 30), um die erste und zweite Rohrlänge (10) zu verbinden. 55
- ### 15 Revendications
1. Assemblage de raccordement (20) destiné à connecter des tubes à fentes extensibles (10), l'assemblage comprenant des première et deuxième parties tubulaires (22, 24), destinées à être montées sur les extrémités des longueurs respectives des tubes à fentes, les parties comportant des fentes (26) et l'extrémité libre de la première partie définissant une partie mâle (28), l'extrémité libre de la deuxième partie définissant une partie femelle (30), de sorte que les extrémités libres des parties sont adaptées à s'engager l'une dans l'autre et à permettre l'extension des parties accouplées d'une manière correspondant aux tubes.
2. Assemblage de raccordement selon la revendication 1, dans lequel les parties (22, 24) sont agencées de sorte que les fentes respectives (26) sont alignées.
3. Assemblage de raccordement selon les revendications 1 ou 2, dans lequel les parties (22, 24) définissent des filets de vis correspondants (32, 34), de sorte que les parties peuvent être montées par une rotation relative.
4. Assemblage de raccordement selon les revendications 1, 2 ou 3, dans lequel les parties (22, 24) sont destinées à permettre un montage par enfoncement.
5. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel les parties (22, 24) définissent des filets de vis correspondants (32, 33), et sont destinées à permettre un montage par une combinaison d'enfoncement et de rotation.
6. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel des éléments de fixation (44) sont prévus pour fixer les parties (22, 24) l'une à l'autre.

7. Assemblage de raccordement selon la revendication 6, dans lequel les éléments de fixation (44) sont agencés près de l'extrémité libre de la partie femelle (30), pour empêcher un évasement vers l'extérieur de l'extrémité sur le tube en cours d'extension. 5
8. Assemblage de raccordement selon les revendications 6 ou 7, dans lequel les éléments de fixation (44) sont amovibles. 10
9. Assemblage de raccordement selon la revendication 8, dans lequel les éléments de fixation sont des vis (44), destinées à être agencées dans des trous appropriés (42, 43) ménagés dans les parties (22, 24), de sorte que les tubes peuvent être séparés en cas d'une opération manquée. 15
10. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel les parties (22, 24) définissent des filets correspondants (32, 33) et peuvent également être fixées l'une à l'autre par des éléments de fixation (44). 20
11. Assemblage de raccordement selon la revendication 10, dans lequel les éléments de fixation (44) s'engagent dans la partie femelle (30) entre son extrémité libre et le filet (33) qui y est agencé. 25
12. Assemblage de raccordement selon la revendication 11, dans lequel les éléments de fixation s'engagent aussi dans la partie mâle (28) entre son extrémité libre et le filet (32) qui y est agencé. 30
13. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel les parties (22, 24) définissent des filets de vis correspondants (32, 33), les filets étant agencés sur les noeuds des parties. 35
14. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel la portion de chaque partie (22, 24), destinée à s'engager dans l'extrémité libre de l'autre partie (24, 22) englobe une rainure évidée (34, 35), l'extrémité libre de l'autre partie définissant une languette (37, 36) en vue d'un agencement dans la rainure (34, 35). 40 45
15. Assemblage de raccordement selon la revendication 14, dans lequel au moins une desdites parties définit un angle de dépouille en vue de l'engagement dans un rebord (39) sur l'extrémité de l'autre partie. 50
16. Assemblage de raccordement selon la revendication 15, dans lequel l'extrémité de la partie mâle (28) comporte un rebord (39) et est agencé de sorte à être déviée vers l'intérieur pour permettre le montage au moins partiel des parties par enfoncement. 55
17. Assemblage de raccordement selon la revendication 16, dans lequel l'adaptation à ladite déviation est assurée par une charnière mobile (38) sur la partie mâle (28).
18. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel les parties (22, 24) sont formées d'une seule pièce avec les longueurs de tubes respectives (10).
19. Assemblage de raccordement selon l'une quelconque des revendications 1 à 17, dans lequel les parties (22, 24) sont destinées à être soudées aux longueurs de tubes respectives (10).
20. Assemblage de raccordement selon l'une quelconque des revendications précédentes, dans lequel des épaulements externes sont agencés sur une ou sur les deux parties (22, 24), pour faciliter la manipulation de l'assemblage (20) et des tubes raccordés.
21. Assemblage de raccordement selon la revendication 20, dans lequel les épaulements sont agencés au niveau des noeuds des parties (22, 24).
22. Procédé de positionnement de longueurs de tubes à fentes (10) raccordés par un assemblage de raccordement (20) selon l'une quelconque des revendications précédentes, dans un alésage, englobant l'étape d'extension radiale des longueurs de tubes (10) et lesdites première et deuxième parties (22, 24) pour former une longueur de tubes étendus ayant un diamètre intérieur pratiquement constant.
23. Procédé de raccordement de tubes à fentes extensibles, le procédé comprenant les étapes ci-dessous:
  - fourniture de première et deuxième longueurs de tubes à fentes (10);
  - fourniture de première et deuxième parties tubulaires à fentes (22, 24) sur les extrémités des longueurs de tubes respectives (10), l'extrémité libre de la première partie définissant une partie mâle (28) et l'extrémité libre de la deuxième partie définissant une partie femelle correspondante (30); et
  - accouplement desdites parties mâle et femelle (28, 30) pour raccorder les première et deuxième longueurs de tubes (10).
